For each assignment, please submit a link to a single git repository containing:
• The code files for the homework (.ipynb, .py, etc)
• Any supporting files/databases required to run, assuming they aren't large (eg: hawaii.sqlite).
• A README.md saying what's in the repo (this can be brief). This is a good place to put any notes about running it, issues, etc.
• No miscellaneous files/folders/versions/stuff. If it is not required for your code to run or relevant to grading, it should not be there. Example input/output files are good as they assist in grading. If you make something cool that you want in that repo, but isn't part of the assignment, shove it into an 'Extras' folder or otherwise obviously name it. (e.g.: "Extra_Experiments.py")

You can (and should) test what the grader will experience by creating an empty folder, running `git clone` on your repo, and running your code.
